Write a function that takes an array of strings and returns an iterator that yields the symbols of the strings in the array.

Example input: `['hello', 'world', 'test']`

Example output: `Symbol(hello), Symbol(world), Symbol(test)`

Hints:

- Use a generator function to create the iterator.
- Use the `Symbol()` function to convert each string to a symbol.
- To iterate over the array, you can either use a `for...of` loop or the `Array.prototype.forEach()` method.

JavaScript best practices to submit the assignment:

- Follow proper variable naming conventions (e.g., use camelCase for variables, use descriptive names)
- Use clear and concise code that is easy to read and understand
- Add comments where necessary to explain the code
- Test the function with various inputs to ensure it works correctly
- Proper indentation should be applied
